

FOR IMMEDIATE RELEASE

## **New Product from New Century Software Simplifies the Pipeline Data Loading Process**

*Express Loader is New Century Software's answer for clients who need a powerful tool to quickly load large amounts of data into a PODS database*

Fort Collins, Colorado. June 19, 2012. New Century Software (<http://www.newcenturysoftware.com>) announces the release of a new bulk data loading application that allows users to easily load a variety of pipeline data into a PODS (Pipeline Open Data Standard) database from multiple sources. This product is specifically tailored to help oil and gas operators involved with new construction, loading new acquisition data, survey data, and those performing annual maintenance.

Express Loader allows users to designate the data they want to load and where they want it stored in PODS. The robust functionality includes tools for mapping data columns and calculating and assigning linear referencing so the highest integrity of pipeline data is being loaded into the database. For ease of use, Express Loader offers a logical workflow and easy-to-read checklist that ensures all required steps are completed before starting the loading process. With its intuitive interface, users can quickly be productive. With Express Loader's proprietary validation process, users can identify and correct data issues *BEFORE* loading, thereby improving pipeline data integrity.

Todd Porter, Vice President and COO of New Century Software comments, "Ease of use was vital when we were planning how and what the software user interface would look like. Users can easily create expressions within Express Loader to automatically manipulate the source data to comply with requirements of the target database instead of editing the source data by hand outside of Express Loader. He goes on, "We built in some great time savers—the work done within Express Loader is reusable. Users can save their column mapping and linear referencing configurations and then reuse them when loading similar data for other projects."

User comfort and productivity was foremost in New Century Software's mind when designing Express Loader. Minimal manual preparation and data editing is required for loading. Built-in filters validate the data any time to discover potential issues and track the corrections. Users can even "pre-load" to make sure it is error-free for loading. Useful reports also enhance the user experience. Those interested in learning more can attend an upcoming webinar: <https://www2.gotomeeting.com/register/918832738>

### **About New Century Software**

New Century Software has been a mainstay in the Oil & Gas Pipeline industry for over 18 years, providing leading Integrity Management solutions for pipeline operators. We work with domestic customers in the U.S. and Canada, as well as with international customers around the world. Our software applications and services help operations successfully load, manage, analyze, and map their asset data. This results in improved risk and asset management decisions that lead to a higher standard of safety and reliability. Our professional services and support teams are responsive and reliable—consistently exceeding our clients' expectations.
