

FOR IMMEDIATE RELEASE

**New Century Software releases enhanced version of Centerline Browser, a Web GIS tool
for quick visual access of pipeline GIS data and networks**

As an Esri ArcGIS Server application, Centerline Browser is an essential tool for pipeline operators who need to share PODS GIS data with a wide variety of users within the organization

Fort Collins, Colorado. September 11, 2012. New Century Software (<http://www.newcenturysoftware.com>) announces the release of version 3.1 of their web-enabled Centerline Browser. Powered by Microsoft Silverlight, this advanced web tool uses ArcGIS Server map services to provide oil and gas operators with a quick and easy way of viewing and analyzing maps, as well as sharing PODS-related pipeline and facility GIS data within their organization.

This latest release of Centerline Browser enables management, operations, and integrity teams to perform a wide variety of tasks, such as finding addresses, viewing map alignment sheets, measuring areas and distances, and obtaining engineering stationing. Operators can also search the underlying PODS database to extract key data they need on the job. Search results can be displayed onscreen or exported for further review and reporting.

Todd Porter, Vice President and COO of New Century Software comments, "Centerline Browser's functionality extends well beyond ArcGIS Server's out-of-the-box Web mapping to create a simple way to visually search, view, and report pipeline data." He adds, "Centerline Browser has been rewritten from the ground up to provide intuitive functionality, allowing a variety of individuals in an organization – regardless of PODS-specific training – to take charge of the pipeline data securely, effectively, through a web browser."

The 3.1 release of Centerline Browser provides many significant improvements in the PODS-enabled web mapping platforms. Some of the major features include:

- Address Geolocation
- Enhanced Identify functionalities
- Integration with New Century Software SheetCutter Server alignment sheets
- Enhanced methods to search and filter PODS tabular data
- Enhanced methods to associate PODS events with pipeline assets

About New Century Software

New Century Software has been a mainstay in the Oil & Gas Pipeline industry for over 18 years, providing leading Integrity Management solutions for pipeline operators. We work with domestic customers in the U.S. and Canada, as well as with international customers around the world. Our software applications and services help operations successfully load, manage, analyze, and map their asset data. This results in improved risk and asset management decisions that lead to a higher standard of safety and reliability. Our professional services and support teams are responsive and reliable—consistently exceeding our clients' expectations.
