

Distribution Integrity Management Program

New Century Software supports gas distribution operators in all stages of DIMP with solutions that help operators comply with regulations and enhance operational efficiency.

Risk Assessment Software

Our Spatial Risk Analyst software can accurately evaluate risk using a regional or segment-based approach. Operators can develop their own risk algorithms, integrate 3rd party models, or purchase the application pre-loaded with the NGA/SGA DIMP risk model.

DIMP Workshops

Schedule an onsite workshop to guide your organization through the process of establishing a roadmap to meet DIMP requirements, identifying and organizing data, developing risk models, tailoring an IM plan, and integrating that solution into the current IT and operational environment.

Data Inventory & Analysis

New Century Software works with operators to identify gaps in the current data, determine which data will be most useful in meeting DIMP, and review current processes and procedures for leak reporting, new installs, maintenance, pipe exposures, and other operations.

Data Conversion

Leverage our pipeline domain expertise to accurately convert data from paper records, maps, CAD drawings, and spreadsheets to a database format. Through proven processes, data is developed and aggregated to enhance its value to the organization.

GIS Strategy

Implement a new GIS or optimize the system currently in place. We deliver services including requirements analysis, business case development, data model design, third-party application integration, and system architecture design.

NGA/SGA DIMP Template Plan

Forty-seven Southern Gas Association (SGA) and Northeast Gas Association (NGA) member companies have established a comprehensive *Distribution Integrity Management Plan Framework and User Guide* for meeting the DIM regulations. These funding members represent over 40% of the distribution customers in the United States. Many more companies have purchased the framework and user guide since the plan was released.

By collectively laying the foundation for a DIMP plan, the companies developed a defensible framework that meets the regulatory requirements, is easy to implement, and can accommodate the wide variability in data readiness of the typical gas distribution operator.

New Century Software has partnered with Structural Integrity Associates to implement the NGA/SGA DIMP Plan. In selecting our team, distribution operators are able to implement a solution that is:

- **Complete** – It addresses all seven DIMP elements
- **Scalable** – It grows with your program and does not require perfect data to get started
- **Comprehensive** – Addresses 72 sub-threats found in gas distribution systems
- **Defensible** – The plan was developed by distribution operators large and small, representing over 40% of services in the US
- **Flexible** – Adapts to your data and processes, not the other way around
- **Cost Effective** – Provides low-cost software with pre-loaded algorithms and template plans
- **Results Oriented** – It establishes a solid foundation for Additional or Accelerated Action

Strategic Partner
